Looking at the code, I realized this was a classification problem; to fix that, I made an edit in the metrics and the loss to accurately reflect that observation.

I changed the line with `model.compile` to have the `loss = categorical_crossentropy`, and the metrics to be accuracy.

Then I went through to metric to plot and I changed it to be accuracy to reflect the change I made in the earlier cell. That then went and changed all the plot titles to accurately reflect this.
